

Formula 1 AutoAero

Automated Wind Tunnel Model Drag Reduction System

PRESSURE ANALYSIS

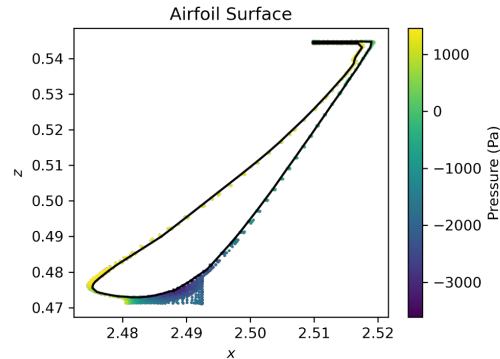

Rear Wing Pressure Data

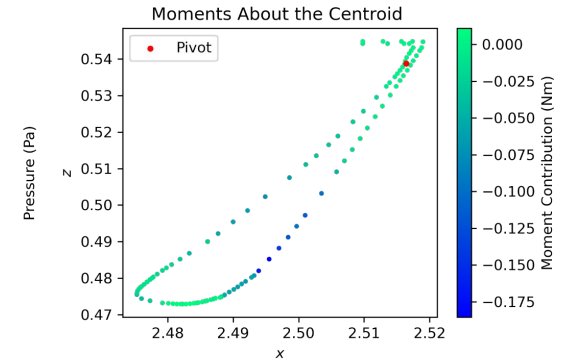

Principles of pressure and moments

Defining the surface using graph traversal techniques

Contributions all pressure loadings along the surface

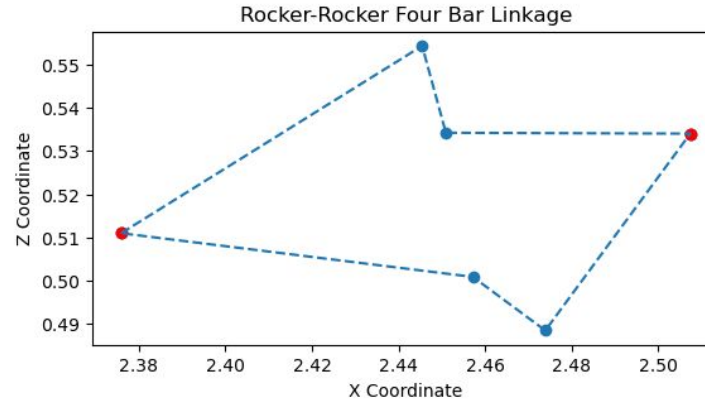

MOTION ANALYSIS

Geometric Modeling
With Constraints

Visual Modeling of
Rocker-Rocker Linkage

LINK DESIGN

$$F_{linear} = \frac{M * q * p * \sin(\frac{\pi}{2} - \theta_2 - \phi_2)}{l * \cos(\phi_2)}$$

$$F_{linear} \approx 2.317\text{N}$$

Material selection guided by
required strength

Accounting for clearance,
required force translation,
and desired motion

$$\tau_{allowable} = \frac{2 * thickness * distance * S_y}{\sqrt{3}}$$

ACTUATOR DESIGN

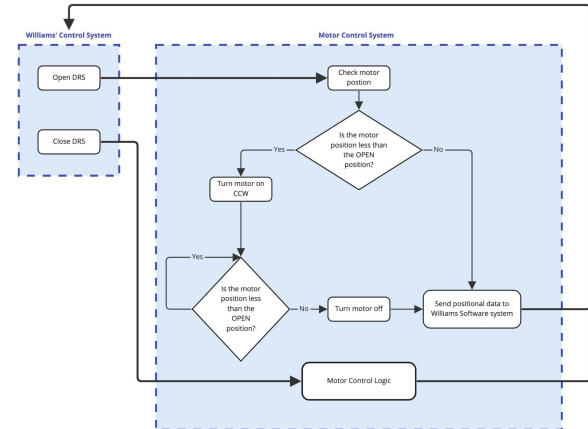

A spool was designed to tether the cable to the motor and allow it to rotate.

Motor was chosen to:

1. Apply at least **0.2 Nm** of torque to position the wing
2. Allow linear movement of **2.74 cm**
3. No speed requirement

Controlled using a microcontroller and user input

FINAL MECHANICAL DESIGN

TESTING

Static Loading Estimate

$$m_{load} = \frac{M_{wing} * r_{centroid}}{g} + \Delta m_{wing}$$
